Homework 2: Initial Specs for Your App

Due: Wednesday, September 23rd at 5:15 PM (before class starts)

For this assignment, I want you to decide on an app idea to run with for your first project. It can be one of the ideas from your initial list, or something new.

Initial Constitution and Specs

Develop an initial constitution and set of preliminary specifications. Follow the format we reviewed in class (Objective, Behavior, Constraints, and Verification).

You may want to follow the tutorial in <https://roelantd.github.io/spec-kit-workshop/02-constitution-phase>, which has some detailed examples. Follow steps 2 and 3, the constitution and specify phases.

Make sure to commit and push your changes.

Initial UI mockup

Use one of the tools discussed in class (Gen AI, Lucidchart, Figma, draw.io, etc.) to generate at least one mockup for a UI. Include this file in your repository.

Your final app may need to have multiple interfaces/windows/menus. You don't have to design for everything at this point, but remember that more upfront design will pay off!

What you'll submit

Submit a link to your GitHub repo.
