UNIVERSITY OF St.Thomas

SEIS 606: Vibe Coding

Fall 2026

Paul Kaefer, Adjunct Professor

One new student introduction!

Preferred name & anything you would like us to know

Already have an app idea? Or a hobby you'd like to build something for?

What's the coolest thing you've built? Could be tech, crafts, etc.

Tonight's Agenda

1. Discuss Homework #2
2. Agile Software Development
3. Continue development

Homework 2 discussion

Volunteers to share their repo?

Has everyone setup Copilot?

UNIVERSITY OF St.Thomas

Recap from last week

Last week, we...

- Developed our constitution for Food4Thought
- Generated a mock-up
- Brainstormed test cases

We're going to spend a lot of time on hands-on construction tonight. But first, let's talk Agile!

UNIVERSITY OF St.Thomas

Agile Software Development

Core concepts

- Iteration! Through sprints (typically ~2 weeks)

Sprint breakdown:

- Daily standup meetings (tasks completed yesterday, work for today, and any blockers)
- Retrospective, or sprint recap. Sometimes a demo is included.
- Sprint planning.
  - As part of this, you review your **backlog** (tasks not yet scheduled)

Agile this semester?

- Think of each week as a mini sprint
- Each week, we'll have a recap, and pickup where we left off.
- We don't have a project tracker (unless someone wants to build one?)
  - We could use GitHub Projects? Tracker
  - OR think of my slides as tracker!

Picking up where we left off…

Let's continue with our /speckit commands

Take our aggregated test cases (from discussion thread on Canvas)

Let's see if Claude can generate a /speckit-specify prompt for us

What's next?

- /speckit-specify, using our generated prompt
- /speckit-plan
- /speckit-tasks

In between each step, let's review!

Once we're ready, we can run /speckit-implement to let the agent run!

Let it run...

/speckit-implement might take a while. What to do as we wait...?

Afterwards, let's:

1. Review the results
2. Run /speckit-converge to validate against our spec, plan, and tasks

We can iterate (implement, converge) as needed.

UNIVERSITY OF St.Thomas

Second project?

Hangman game!

Let's discuss my initial /speckit-constitution prompt.

<Hangman> test cases

Potential test cases:

- Ties?
- empty input?
- All letters guessed, but one word left?

UNIVERSITY OF St.Thomas

Recap (and more...)

/speckit commands

/speckit-constitution – Establishes the project's governing principles. Run once, or as needed

/speckit-specify – Defines *what* you're building and *why* (features, user stories, requirements)

/speckit-plan – Turns the spec into a technical implementation plan.

/speckit-tasks – Breaks the plan into an ordered, actionable task list.

/speckit-implement – Executes the task list and produces actual code.

/speckit-converge – Compares the resulting **code** against the spec, plan, and tasks *after* implementation

- Typical loop is implement-converge-(new/modified tasks?)-implement-converge-…

Optional commands

/speckit-clarify – Asks structured questions to surface ambiguity in the spec before moving to planning.

/speckit-analyze – Checks consistency across the artifacts themselves (spec vs. plan vs. tasks) *before* implementation starts — a pre-build sanity check, not a code check.

/speckit-taskstoissues – Converts the generated task list into GitHub Issues. Useful if you want task tracking to live in GitHub's own interface rather than just the local tasks.md file.

Homework #3

Follow what we did in class today for your project.

Also a **brief** report, in your own words, about what you learned & how long it took (especially the initial implement step).

Class will be only on Zoom next Wednesday (9/30).

UNIVERSITY OF St.Thomas

Questions before we part ways?
